Objective

Prepare smoke test cases for the main features of a simple website/application to confirm the build is stable enough for further QA testing.

Smoke Testing Definition

Smoke testing is a broad, high-level validation performed after a new build is deployed. It checks critical application flows such as launch, login, navigation, create/edit/delete, validation, logout, and session handling.

Smoke Test Cases

Test ID	Feature	Scenario	Precondition	Steps	Expected Result	Status	Priority
ST-001	Application Launch	Verify the website/application opens successfully	Application URL is accessible	Open the app URL	Application loads without server/browser error	Pass	High
ST-002	Homepage Load	Verify homepage UI loads correctly	Application is launched	Observe header, navigation, content, and footer	Main page sections are visible and aligned	Pass	High
ST-003	Login Page Access	Verify login page can be opened	Application is launched	Click Login / navigate to login page	Login page opens with username and password fields	Pass	High
ST-004	Valid Login	Verify user can login with valid credentials	Valid test user exists	Enter valid credentials and submit	User is authenticated and dashboard is displayed	Pass	Critical
ST-005	Invalid Login Handling	Verify invalid login does not allow access	Login page is available	Enter invalid credentials and submit	Error message appears; user remains unauthenticated	Pass	High
ST-006	Navigation Menu	Verify main navigation links work	User is on homepage/dashboard	Click each main navigation item	Each page opens without broken links	Pass	High
ST-007	Search Basic Availability	Verify search field is visible and usable	Application page has search feature	Click search field and type a keyword	Search input accepts text and returns/filters results	Pass	Medium
ST-008	Create/Add Main Record	Verify a main record can be created	User is logged in	Open add form, enter mandatory fields, save	Record saves successfully and appears in list	Pass	Critical
ST-009	Edit Main Record	Verify an existing record can be edited	At least one record exists	Open edit page, update value, save	Updated value is stored and displayed	Pass	High
ST-010	Delete/Remove Record	Verify a record can be deleted with confirmation	Test record exists	Click delete and confirm	Record is removed or marked deleted as designed	Pass	High

Test ID	Feature	Scenario	Precondition	Steps	Expected Result	Status	Priority
ST-011	Form Mandatory Fields	Verify required fields are validated	Form page is available	Submit form with mandatory fields blank	Validation errors appear and form is not submitted	Pass	High
ST-012	Logout	Verify user can log out	User is logged in	Click Logout	Session ends and user is returned to login/home page	Pass	Critical
ST-013	Session Restriction	Verify restricted page cannot be opened after logout	User has logged out	Try to access dashboard/restricted URL	User is redirected to login or access denied page	Pass	Critical
ST-014	Browser Compatibility	Verify application loads in supported browsers	Chrome/Edge available	Open application in supported browsers	Core pages render and function correctly	Pass	Medium
ST-015	Basic Error-Free Flow	Verify no major console/server errors occur during critical flow	Application is available	Perform launch, login, navigation, create, edit, logout	No blocking errors observed	Pass	High
